PATIENT INFORMATION:

Name: _____ Date of Birth: _____

Soc Sec #: _____ Phone: (_____) _____

Date of Injury: _____ Insurance Type: WC Auto Commercial

Insurance Co: _____ Claim/ID#: _____

Adjuster Ph: (_____) _____ Adjuster Fax: (_____) _____

Reason for Referral/Medical Dxs (ICD-9): _____

Scheduling Preference: Please call patient to schedule. Patient will call to schedule.

PLEASE EVALUATE:

Psychological Pain Evaluation

For patients with delayed recovery and/or for whom psychological factors may be contributing to their clinical presentation. Includes thorough evaluation of psychosocial strengths and risk factors including affective disorders, problematic coping, and somatization, along with specific recommendations for psychosocial intervention and medical management (e.g., opioid risk assessment, etc.).

Presurgical Psychological Evaluation

Evaluation of psychosocial factors known to affect outcomes for orthopedic/spine surgeries and neuromodulation trials (e.g., spinal cord or peripheral nerve stimulators). Evaluation includes determination of surgical candidacy/prognosis (good, fair, poor) to assist with medical decision making and treatment recommendations for achieving the best possible outcome.

Comprehensive Psychological Evaluation

In addition to evaluating emotional functioning and behavioral health, this evaluation also includes assessment of intellectual functioning (estimated or actual IQ, if indicated), reading level to assess literacy/premorbidity IQ, and further evaluation of personality functioning/Axis II disorder(s) to aid in diagnostic clarification.

Comprehensive Neuropsychological Evaluation

A full battery of neuropsychological tests to evaluate the following domains: intellectual functioning, academic achievement, sensory perception, motor/visuomotor skills, verbal abilities, attention/concentration, information processing speed, spatial abilities, learning, memory, executive functioning, and personality/emotional functioning.

Neuropsychological Screening

An abbreviated neuropsychological test battery used for early assessment (e.g. 8 to 12 weeks post injury) of the most common cognitive complaints associated with a mild traumatic brain injury. May also be utilized for patients with complaints of attentional difficulties and/or memory loss (e.g. due to chemotherapy or a general medical condition).

Behavioral Health Evaluation

This evaluation is designed for medical (vs. psychiatric) patients seen through *commercial insurance plans* who do not have the same level of psychosocial risk as patients involved with a Workers' Compensation claim. It is most appropriate for patients who require an initial behavioral medicine assessment, such as prior to interventional pain management, neuromodulation trials, or orthopedic/spine surgery. Please note: If a patient's chief complaints are primarily psychological in nature and medical issues are secondary, or if extensive psychological intervention is anticipated, it may be best to refer the patient to a mental health provider in their behavioral health network.

Psychological Consultation

A 90 to 120-minute clinical interview will be performed to gather information pertaining to the patient's chief complaints and psychosocial history, which along with screening measures will assist with formulating preliminary diagnostic impressions and recommendations for treatment. All referrals for treatment (psychotherapy and/or biofeedback) will begin with a Psychological Consultation unless a full evaluation (as per above) has already been completed.

PLEASE TREAT:

As Indicated Individual Psychotherapy: _____ Sessions Biofeedback: _____ Sessions Eval Only

REFERRING PHYSICIAN (Signature): _____

Ph: (_____) _____ Fax: (_____) _____ Date: _____

Please send pertinent medical records and first report of injury (if available) with referral. Thank you!
